

What is claimed is:

1. A discharging method for a liquid material discharging said liquid material onto a substrate from a discharging apparatus of the liquid material comprising a discharging head which discharges the liquid material; wherein
at least after discharging said liquid material onto said substrate, an ionized wind is provided toward the liquid material on the substrate.
2. A discharging method for a liquid material according to claim 1, wherein
said substrate comprises a easily chargeable constituent elements, and
before discharging said liquid material, an ionized wind is provided on said substrate.
3. A discharging method for a liquid material according to claim 2, wherein
said easily chargeable constituent elements is an active element.
4. A discharging method for a liquid material according to claim 1, wherein
said liquid material is made of an easily chargeable constituent elements, and
before discharging said liquid material, an ionized wind is provided on said substrate.
5. A discharging method for a liquid material according to claim 4, wherein
said liquid material composed of said easily chargeable material is a metal wiring material.
6. A discharging method for a liquid material, wherein
when discharging a liquid material onto a substrate comprising an easily chargeable constituent elements, an ionized wind is provided on said substrate at least before discharging said liquid material.

7. A discharging method for a liquid material according to claim 6, wherein
said easily chargeable constituent elements is an active element.
8. A discharging apparatus for a liquid material, comprising:
 - a substrate holding part for holding a substrate;
 - a discharging head for discharging the liquid material onto said substrate; and
 - an ionized wind producing means for providing an ionized wind on said substrate, andsaid substrate comprises an easily chargeable constituent elements.
9. A discharging apparatus for a liquid material comprising:
 - a substrate holding part for holding a substrate;
 - a discharging head for discharging the liquid material onto said substrate; and
 - an ionized wind producing means for providing an ionized wind onto said substrate, andsaid liquid material is an easily chargeable material.
10. A discharging apparatus for a liquid material comprising:
 - a substrate holding part for holding a substrate;
 - a discharging head for discharging the liquid material onto said substrate;
 - an ionized wind producing means for providing an ionized wind onto said substrate; andan exhaust means provided along a direction where said ionized wind from said ionized wind producing means is blowing.
11. An electronic device in which one part of a constituent elements is formed using a discharging apparatus according to claim 1.

12. An electronic device in which at least one part thereof is made using a discharging apparatus of a liquid material according to claim 8.
